

INSTRUCTION FOR USE - SUCK-IT

The product is used to absorb water based liquids. The absorption capacity varies with the amount of dissolved minerals in the liquid such as lime or salt. The more dissolved minerals in the liquid the less the product will absorb.

The 5 litre version will absorb 4.5-5 litres of normal tap water, and the product can be used several times until the maximum capacity is reached.

The product is based on non toxic materials and can be disposed of as normal household waste after use, unless the product has been used to absorb a liquid that requires special treatment or disposal, in which case the used product is disposed of as is required for the absorbed liquid.

The absorbent part of the product is meant to remain inside the cover during use. This ensures that the liquid being absorbed won't get into contact with and potentially soil or damage the surroundings during use.

- Use a knife to cut a u shaped opening in the cover on the topside of the product. Make the cut inside the punctured line so that the plastic cover covers 3-4 centimetre of the absorbent core all the way around. This ensures that the core will lift the cover when it expands during absorption.
- Fold the lid you have made back so that the product is open and ready for use. Place the product under the pipe or container where liquid is expected to come out.
- Let the liquid drain into the product through the opening you have made in the cover.
- When the liquid is added to the product fold the lid back over the opening and leave the product to absorb for a few minutes until the liquid is absorbed by the core.
- When the liquid is absorbed, the product can be picked up and disposed of.

If you have any questions about the use of the product or if you might have a use for different shapes and sizes then you are always welcome to contact us at the address: MSL Absorbent Products ApS. Nordre Frihavnsvej 88. DK-2100 Copenhagen. Denmark. Telephone +45 35428809. Web: www.mslproducts.com.
